

ABSTRACT OF THE DISCLOSURE

A wheelchair storage and moving assembly includes a housing
5 having a top wall, a bottom wall, a back wall and a pair of lateral walls. A
front side of the housing forms an entry into an interior of the housing. A
door has a bottom edge, a top edge and a pair of side edges. A hinge
hingedly couples the bottom edge the bottom wall adjacent to the entry
such that the door may be positioned in a vertical position covering the
10 entry or angled away from the housing and defining a ramp. A coupler is
mounted on the door for selectively coupling the door to the housing in a
closed position. A plurality of securing members selectively secures the
housing to the vehicle such that one of the lateral walls faces the vehicle.
